

AUTO-TYPE: STOP COPYING YOUR PASSWORD

Rise 360 Storyboard — Single-Concept Microlearning

Companion piece: KeePass: Work Smarter, Stay Secure (full course)

Tool: Articulate Rise 360

Estimated duration: ~2 minutes

Screen count: 5

Learning objective (singular): Learner will be able to use KeePass's Auto-Type feature (Ctrl+Alt+A) to log into a saved account without copying or pasting the password.

Audience: Same as companion course — employees using KeePass for company credentials.

DESIGN SYSTEM (shared with companion course)

- Header blocks: solid blue (#2E5C93) background, white bold heading text — matches KeePass course topic headers
- Photography: same warm, modern office stock-photo style (natural light, muted tones)
- Buttons: solid blue “CONTINUE” button, white bold label, same placement/style as companion course
- Callout/info boxes: light blue background, blue left border, info icon — matches the “There is no forgot password” box style from the KeePass course
- Tone: second-person, plain language, same voice as companion piece (e.g., “You need to log into a client CRM you use every day...”)
- No sub-numbered topics or multi-scene branching — this is a single continuous flow, deliberately shorter and flatter than the companion course

SCREEN-BY-SCREEN STORYBOARD

Screen	Block Type	On-Screen Content	Design / Interaction Notes
1	<i>Title / Cover block</i>	Auto-Type: Stop Copying Your Password A 2-minute look at KeePass’s built-in shortcut for logging in faster — without ever copying your password. Estimated time to complete: 2 min [CONTINUE]	Same cover layout as KeePass course: full-width photo banner, dark overlay, white title text. Suggested image: hands on a laptop keyboard, close-up (signals “shortcut/action,” distinct from the companion course’s stressed-worker opening image.)
2	<i>Text + image block</i>	The Copy-Paste Habit Every time you log into a site, you probably copy your password from KeePass, alt-tab to the browser, and paste it in. It works — but every password you copy sits in your clipboard until something else overwrites it. Any other app running on your machine can potentially read it while it’s there.	Image: simple icon-style graphic — a clipboard with a small “exposed/visible” indicator (eye icon or highlight). Keep it illustrative, not alarmist — matches the informational (not fear-based) tone of the companion course. No blue section header bar on this screen — reserve that treatment for Screen 3’s key callout, so the one visual emphasis point

Screen	Block Type	On-Screen Content	Design / Interaction Notes
			stands out.
3	Text block + info callout	Auto-Type Skips the Clipboard Entirely Select the entry in KeePass, then press Ctrl+Alt+A. KeePass finds the active window and types your username and password directly into it — no copy, no paste, nothing sitting in your clipboard. 💡 <i>Auto-Type matches entries to browser windows automatically. For most saved logins, you don't even need to switch to KeePass first — just press Ctrl+Alt+A from wherever you are.</i>	Info callout styled exactly like the “There is no forgot password” box in the companion course: light blue fill, left border accent, small info icon top-left. This is the single most important screen — the shortcut itself. Consider bolding “Ctrl+Alt+A” or setting it in a small code/keycap style if Rise allows, so it visually anchors as the one thing to remember.
4	Knowledge check (multiple choice, single question)	Quick Check You need to log into a client CRM you use every day. What's the Auto-Type way to do it? 1. Copy the password from KeePass, alt-tab over, and paste it in. 2. Select the entry, then press Ctrl+Alt+A. 3. Type it from memory since you use it so often. Correct answer: Option 2 Correct feedback: “Exactly — Auto-Type sends it directly, no clipboard involved.” Incorrect feedback: “Not quite — Auto-Type (Ctrl+Alt+A) skips copy and paste entirely. Give it another try.”	Deliberately a single graded question, not a branching scenario — this is what keeps the piece “micro” rather than a scaled-down version of the branching knowledge check in the companion course. Reuses the exact “daily login” scenario premise from the companion course’s branching check, but as a standalone question — reinforces that these two pieces share one world without duplicating content wholesale.
5	Closing / wrap-up block	Two Minutes Well Spent Next login, skip the copy-paste — press Ctrl+Alt+A and let Auto-Type do it. <i>Thank you for completing this microlearning. You may now close this browser.</i>	Same close-out treatment as companion course (short affirmation line + “you may close this browser”). No “Start Over” control needed here — that’s appropriate for the branching scenario in the full course, but adds unneeded weight to a single straight-through flow.

WHY THIS STAYS “MICRO” (build discipline notes)

- One objective, stated once — not a list of four like the companion course.
- No numbered topic sections (“1. ... 2. ...”) — a single continuous scroll signals one idea, not a multi-part course.
- One knowledge check question, not a 3-scenario branching path.

- No video block — the full course carries two instructional videos; this piece proves the concept can stand on text + one interaction alone.
- Target build: 5 screens, ~2 minutes — resist the temptation to add a second example or a bonus tip. If it needs a second idea, it's no longer single-concept.
